

Compare canola seed treatments.

When it comes to pests and disease—whether it’s flea beetles, rhizoctonia or blackleg—it’s best to be prepared. Blackleg is a growing challenge for many growers and can cause significant yield loss in canola. That’s why a seed treatment is an essential tool to add to an integrated pest management program as a strong defense against these significant threats.

With four fungicide active ingredients and a frontline insecticide, new Vercoras® seed treatment delivers broad-spectrum protection against key seed- and soil-borne diseases such as blackleg, as well as base protection against flea beetles.¹ And it’s the first complete seed treatment designed to control airborne blackleg through the critical early-season infection period.
