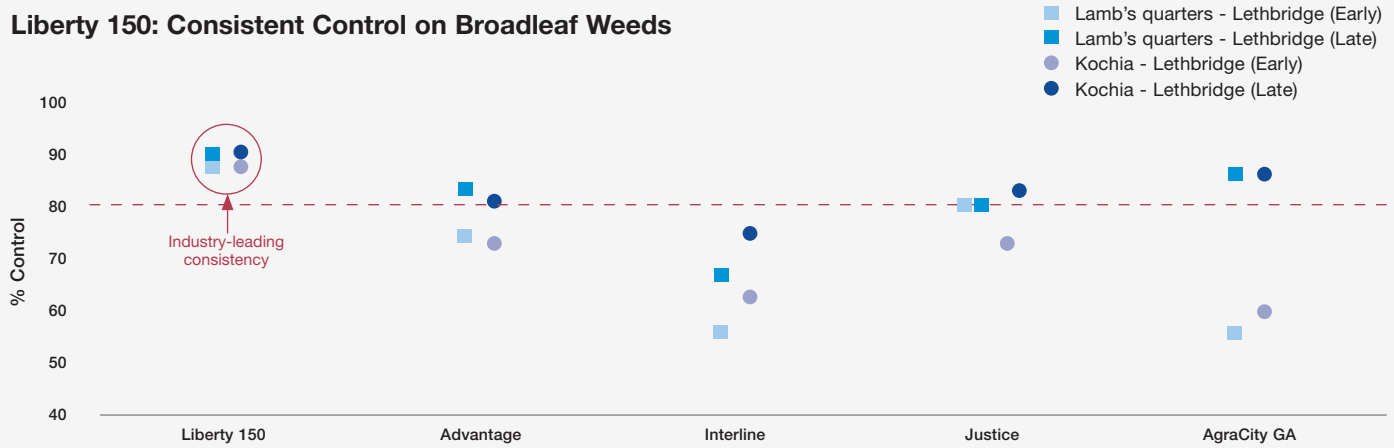
Consistent control.

Even when the environment is unpredictable, Liberty 150 is not. The following trial results are from a BASF research farm in Lethbridge, AB. These plots faced a number of challenging conditions including but not limited to below average temperatures, a wide range of weed stages and heavy weed pressure.

Each dot indicates an evaluation point measuring the control of kochia or lamb's quarters (%). When the dots are close together – as with Liberty 150 – it represents the consistent performance Liberty 150 provides, regardless of certain environmental conditions. This consistent, industry-leading control is what growers depend on with Liberty 150.



Source: BASF RCD Trials, 2020; n = 4 **Trial dose rate:** 1.35L/ac rate for Liberty 150 and competitors; Evaluations 28 to 35 DAT
Weed stage: Broadleaf weeds were 2 to 9 cm. Trials were conducted on bare ground and applied within the registered application window for labelled weeds. Glufosinate ammonium applied alone.

Results may vary on your farm due to environmental factors and preferred management practices.

Performance Support Guarantee.

Liberty 150 is a part of the Advanced Weed Control program, a complete weed management strategy, developed to tackle your specific weed challenges.[1] AWC combines a resistance management approach with effective herbicides. Backed by the Performance Support Guarantee, our team will go the extra mile to earn your trust and help you achieve weed-free fields.

[1] When adhering to specified rates outlined in the product label for the weeds outlined in the program.
